

2008 HAWK MIGRATION

NORTHEAST HAWKWATCH REPORT

The North East Hawk Watch promotes the systematic study of migrating hawks in New England, eastern New York, and northeast New Jersey. The planning for NEHW activities is carried on by the Officers and a Board of Directors. Membership is open to anyone. Annual dues are \$10 payable to the treasurer: John Weeks, 51 Pheasant Run, N. Granby CT 06060. Other officers: Paul Roberts, President - 254 Arlington St. Medford, MA 02155; Larry Fischer, Vice President, 124 Sugar Street, Newtown, CT 06470; Seth Kellogg, Clerk - 377 Loomis St. Southwick, MA 01077

Visit the web page for North East Hawk Watch at www.battaly.com/nehw/ to download a membership application, view seasonal site totals at all sites and daily counts at selected sites for 2007, download the entire Hawkwatch Report for 2006, and find directions to hawkwatch sites in the Northeast.

All counts should be reported promptly online through a free service offered by the Hawk Migration Association of North America. To sign up, visit www.hawkcount.org and click the 'Account Request' link. Your contact information and site details will be authenticated and an account created. To receive daily reports from all sites using the hawkcount program, subscribe to BIRDHAWK, which is also free and can be done by visiting the HMNA homepage at www.hmana.org and following the instructions there.

If you are unable to use this online reporting system, single day

(hourly) white report forms and seasonal summaries of daily totals should be sent to the state coordinators listed below by August 1 (spring) and February 1 (fall). Timely submission is essential if this report is to be printed and mailed to you on time.

MAINE & NEW HAMPSHIRE - Sue Fogleman, 34 Meadow Lane, Campton NH 03223; fogleman@cyberportal.net

The front and back cover art is by Paul Carrier of Harwinton, Connecticut, who has been drawing our covers since 1974. The NEHW logo was designed by Sue Fogleman of New Hampshire.

To support the work of the Hawk Migration Association of North America and receive the journal, Hawk Migration Studies, send a check for \$25 covering dues for one year to the Membership Secretary: John Weeks, 51 Pheasant Run, N. Granby CT 06060.

THE 2008 SPRING MIGRATION

COVERAGE AND SITE ACCOUNTS

There was no coverage at Hook Mt this year, but the Sandy Hook data was made available. There were nine sites with substantial coverage compared to eight in 2007, bringing the regional hours to its highest point ever, 34% higher than 2007 and 12% more than the previous high in 2004. Bradbury Mt again had the most hours in only its second year of full time coverage. Peak Mt reached 300 hours and Quaker Ridge and Plum Island continued their recent good work.

Hours at **Sandy Hook** were 28% below the 1999-2004 average, but migrants per hour were almost exactly the average of those six years and 2008. For those seven years, it was the best absolute count of Osprey, Bald Eagle, Harrier, Merlin, and Peregrine. Turkey Vulture and Red-tailed Hawk were near average, both accipiters, Red-shoulder, and Kestrel were well below average.

Montclair has now produced 23 consecutive years of comparable coverage, and the last one was the poorest by far, but I doubt this will turn off watchers there. It is hard to find a bright light among the grim numbers, especially the abysmal total of Red-tailed Hawks, a number almost equaled by Merlins. The ten Peregrine Falcons and nine Bald Eagles will have to be the only cause for comfort. Northern Harriers and Cooper's Hawks were at least respectable, but that is cold consolation for the performance of the remaining species.

If the birds flew farther inland, it must have been far inland, for **Wildcat Ridge** could not find many migrants either. Coverage there improved a bit, but only the Cooper's Hawk could boast of above average numbers in the sixth year of coverage at a lower level than the heady years of 1997-2002, when full time meant really full. Hours were still 20% below the six-year recent average and only the Cooper's Hawk was higher than its migrant average over that time. This was a big disappointment after a very fine 2007 flight.

Quaker Ridge almost doubled its more modest hours, but the species counts showed only a slight increase. The Osprey and American Kestrel both performed much better, but there were fewer Red-shouldered and Red-tailed Hawks. That was likely due to a late start, but the increases in most April migrant numbers were small. This nascent effort is well worth continuing, however.

The fourth year at the **Peak Mt** site was its best in terms of coverage, bouncing back from an hourly decline in 2007 and reaching the full time level of exactly 300 hours, not bad for essentially a one-man operation. Every common species set a new high for numbers except for Broad-winged Hawk and Red-tailed Hawk. Northern Harrier, Cooper's Hawk, American Kestrel, and Merlin were especially impressive.

One day of watching at Blueberry Hill and two at Shatterack Mt. were all that was reported at these full-time fall watches.

Hours stayed the same as 2007 at **Barre Falls**, but migrants showed poorly almost across the board. Only Turkey Vulture was above average and only Red-shouldered Hawk was near average. Osprey and American Kestrel were especially disappointing.

Coverage was comparable at **Pilgrim Heights** and counts were as well. It was a record season for Turkey Vulture, Red-shouldered Hawk, and Broad-winged Hawk. The Peregrine Falcon count was high, and only the Sharp-shinned Hawk total was dismal, a record low. The per-hour number for all species was slightly below average and four Mississippi Kites brought the nine-year total of these now New England breeders to 36.

Plum Island reported significant coverage for the third straight year, in fact doubling the hours of the previous two years. The falcons responded very well, with the third best total of American Kestrel ever reported. Northern Harriers and Ospreys also showed well and four Rough-legged Hawks is a first. The Sharp-shinned Hawk flight was disappointing, but there are only high hopes for this watch now.

The “amazing” watch at **Bradbury Mt** in 2007 proved only too easy to “maintain.” The spring of 2008 outperformed the previous year in every way, although a single Rough-legged Hawk was two fewer than in 2007. Who is going to complain with over 400 hours and a migrant per-hour average of 8.6? It is hard to pick out a species or two that was most improved, since almost all at least doubled their numbers. One would have to pick the Merlin jumping from 25 to 91 or the Bald Eagle count of 96, up from 38. Too bad - the Red-tailed Hawk increase was only 8%.

SPECIES ACCOUNTS

Two years of improved flights for **Broad-winged Hawk** proved not to be a trend, as per-hour counts dropped to the lowest level ever and 47% below the ten-year average. The absolute count was higher than 2004-2005, but not by much. It amounted to only 28% of the total migrants, well below the percents posted in 2005-2007, but slightly above the lowest ever in 2004. Bradbury Mt ran away with top spot (1463), with Montclair (526), Peak Mt. (487), and Pilgrim Heights (499) lagging far behind.

The per-hour count of **Ospreys** was lower than three of the last four years, but still managed to hit the 10-year average, which is very near the 20-year average. Best count was again at Bradbury Mt. (389), with Montclair, Pilgrim Heights, Sandy Hook, Montclair, and Peak Mt. all coming in at about a third of Bradbury's total, which broke the seasonal record of 351 set back in 1989.

Per-hour numbers of **Bald Eagle** dropped slightly, but were still 31% above the ten-year average. The all-time high absolute count set last year was shattered, however. The 96 counted at Bradbury Mt far out-distanced any other watch, in 2008 or ever.

In 2008 the **Northern Harrier** inched upward again, but did not reach the record level per-hour of 2004. It was 29% above the ten-year average and in absolute terms was second to the regional high recorded in 1989. Sandy Hook had the biggest seasonal flight (139), its and the region's best count since 1994.

After a very good flight in 2007, **accipiters** suffered a setback in 2008, Sharpshins declining to a count 17% below the ten-year average and 19% below the 20-year average. Cooper's Hawk dropped 23% from 2007 per-hour numbers and was just below

the 20-year average. Altogether they comprised 22% of the total migrant flight, better than 2004-2005, but down seven points from 2007. The Sharp-shin/Cooper's ratio rose to 6.7 to 1, above the 6.2 to 1 in 2007 and equal to 2006. Bradbury Mt and Sandy Hook recorded the same number of Sharpshins, but Sandy Hook had more than twice as many Cooper's Hawks even though that number was low. Bradbury had an unusual 18 to 1 Sharpshin to Cooper's ratio. The 17 Goshawks was the biggest count since 1992.

All three **falcon** numbers rose per-hour for the third straight year, and the Kestrel equaled its ten-year average. The Merlin was 25% above that average and the Peregrine 70% rising to a record per-hour figure. Both of the bigger falcons set new high records in absolute numbers, the previous marks made in 2000. Falcons made up 18% of the flight and the Kestrel to Merlin ratio was 4.3 to 1. Plum Island swelled the Kestrel count with 663, almost doubling Sandy Hook's 387 and more than doubling the 327 at Bradbury Mt. Sandy Hook ran away with the top spot for Merlins, its 219 being almost half of the regional total. They also had the most Peregrines, 27, compared to 20 at Pilgrim Heights.

It was an near average year for **Red-shouldered Hawks**, whose per-hour figure has not varied much since 2000. The absolute number was the highest since 1999, though still 10% below the ten-year per-hour average. Bradbury squeaked by Montclair for the best count, closely followed by Sandy Hook and Peak Mt.

The up and down seesaw continues for **Red-tailed Hawks** as they fell to 26% below the ten-year per-hour average. This was a huge 38% below the 2007 figure. Bradbury Mt had the highest total, followed by Peak Mt. and Barre Falls.

The **Black Vulture** dropped substantially from its record-setting 2007 season and the **Turkey Vulture** also declined to a point a bit below the ten-year average. There were 16 **Rough-legged Hawks**, the most ever, but not a single **Golden Eagle**. Pilgrim Heights recorded four **Mississippi Kites** and Sandy Hook three. Three **Swallow-tailed Kites** were seen, two at Sandy Hook and one at Bradbury Mt.

FLIGHT ACCOUNT

Except for a Redshoulder at Wildcat on 2/16, there were no migrants until 2/24. Only Wildcat and Peak Mt. had coverage until March 6, when Barre Falls and Pilgrim Hts. joined in. Bradbury, Montclair, and Sandy Hook started on March 15, but migrants were scarce through the 16th. Peak counts were 12 TVs on 2/25 and 7 Redtails on 3/2 and 3/13, all at Peak Mt. For this pre-flight period there were 150 hours of coverage and 192 migrants, including 73 TVs, 59 Redtails, and 17 Redshoulders among 616 migrants

March 17-27

The northwest winds weakened and then turned south on 3/18 to allow the first real flight day of the 2008 season before a front arrived from the west. After the storm, the strong northwest winds 3/20-21 kept things quiet. On March 22 clouds moved into the south, and a few birds began to reach us on lighter winds as a huge high center dominated the east. By March 26-27 the winds had freshened from the southwest and the peak early flight ended with a push of Redtails at Bradbury Mt. (38). A front stalled over the region on 3/28, and rain came from the west to close things down. There were 58 watch days and 299 hours of coverage in this period, producing 1193 migrants or 4 per-hour. Vultures and early buteos each totalled 418, or 35% of the total.

March 28-April 11

Despite the rain on March 28, Sandy Hook managed 89 Kestrels, but the next three days of north and east winds with unsettled weather kept things very quiet, not the traditional late March push. The stormy weather was pushed out to sea on April 2, when a huge high pressure took over the east, bringing another northwest flow and few birds. The high's departure brought more rain out of the southwest April 3, and it lingered there for five days, cutting off any new migrants. Though the rain had stopped, the east winds and clouds still persisted April 9-10, and only Bradbury Mt. had any numbers over the two days. A weak cold front finally passed on April 10, quickly stalled, and turned back into an advancing warm front bringing more clouds and rain. There were 81 watch days over this bleak period with watchers enduring 411 hours that only provided 1197 migrants. That translates to a meagre 2.9 per-hour. That total was spread almost evenly among the species and families, 256 vultures, 173 Ospreys, Bald Eagles and Harriers, 293 accipiters, 223 buteos, and 243 falcons.

April 12-28

Hopes rose as the next cold front brought light north winds and a major warming April 12-14. Migrants moved in decent numbers and Broadwings started to appear. Kestrels made a big push everywhere on April 12 with 179 at Sandy Hook, 41 at Quaker Ridge, and 50 at Peak Mt. The next day a whopping 376 were counted at Plum Island. Ospreys joined in that day with 35 at Montclair and 44 at Bradbury Mt. Plum Island had an amazing flight of 46 Harriers, the third best ever in the region, and the best Broadwing totals were 172 at Montclair, 114 at Quaker Ridge, and 85 at Rose Tree Park. April 13 was a pretty god day all around.

Watchers would have to pay a big price for this strong flight in the early peak season, for it marked the end of cold fronts and west winds. Temperatures continued mild with winds light and from the east the next four days as the entire region was engulfed by a high pressure center that moved slowly to and off the coast. Migration was dispersed at a slow, steady pace with no strong winds or delays to concentrate the flight. Accipiters were especially scarce considering it was peak time. Bradbury Mt. had 38 Sharpshins and 47 Ospreys on April 14, high counts for the four days. Broadwing peaks were 75 at Barre Falls and 58 at Montclair on 4/14, with another 65 at Montclair the next day.

On April 15 a front finally dropped down from the north with some serious intent. The serious part was north winds, but they were strong only in the north and only for a single day. There was also no letup in the mild temperatures as the lazy caravan of migrants started up again. As the end of the month approached, warm, calm conditions with south and southeast winds continued as the high pressure lingered off the coast and weak fronts delayed their approach and died when they arrived. The resulting counts were modest, as migrants dispersed across a wide path. The only bright spot was Bradbury Mt., where a string of six days with steady numbers 4/16-21 ended strongly with 155 Sharpshins, 363 Broadwings, 41 Ospreys, and 88 Kestrels on April 22-23. A long delayed classic cold front came from the west on April 27. Rain closed down the whole region the next day and lingered in the north a second day. The peak season had 131 watch-days and 746 hours, with only 6755 migrants and a low passage rate of 9.1 per-hour. An unreal 29% of the flight was at only one site, Bradbury Mt.

April 29-May 6

April finished with a bit of a flourish as a warm front swept up from the south, and the wind turned southwest. Birds still flew, and they flew even stronger after a cool front with clouds and drizzle swung through from the west on May 3. The winds turned west and the accipiters whisked up the coast again on May 4, 124 at Sandy Hook along with 58 Merlins and a regional all time record 13 Peregrines. The next day 65 Broadwings were seen over Peak Mt. Then on May 5-6 Bradbury Mt. had yet another stellar two-day flight with 32 Osprey, 201 Sharpshins, 237 Broadwings, 35 Kestrels, and 26 Merlins. Only two days later, on May 8, Sandy Hook had one more sweet day, featuring a Swallow-tailed Kite, and three Mississippi Kites to go with 23 Ospreys, 23 Harriers and 13 Merlins. This was one day after Pilgrim Heights had two Mississippi Kites. It was also two days before Bradbury Mt. had a Swallow-tailed Kite. Thus ended the peak season, a bit late, but on a good note. The period had 62 watch-days and 360 hours of watching, recording only 3273 migrants, another 9.1 per-hour.

Coastal flights continue even later, of course, and of note were 133 Broadwings on May 29 and another 51 on June 3 at Pilgrim Heights. Spring continues to be a fascinating time to monitor hawk migration in the east.

THE 2008 FALL MIGRATION

SITE ACCOUNTS

There were 41 sites reporting, five fewer than 2007. Two years of the Helderberg New York data reached my desk and are now included in the 2007 and 2008 data. A major addition in 2008 was a new site in Concord, New Hampshire, where Robert Vallieres watched from Carter Hill for over 200 hours. Sunrise, New Jersey returned with a few hours of work.

There was no coverage at East Shore Park. Other losses were Duke Farms, where the two year experiment showed that its twin site of Chimney Rock was more productive. Also lost were four low-coverage intermittent sites in western Connecticut.

The number of major watches (+200 hours) dropped by one to 19, Carter Hill was added, but Shatterack and Lenoir fell below the threshold. Lighthouse Point (612) followed by Quaker Ridge (611) were neck and neck for most hours, with Chestnut Ridge (603) not far behind. Chimney Rock, Montclair, and Blueberry broke 500, and there were seven sites in the 350-500 range.

COASTAL MAINE AND MASSACHUSETTS

After a stellar season in 2007, the counts at **Cadillac Mt** were mixed in 2008. Records highs were set for Osprey, Bald Eagle, Marlin and Peregrine, with the Redtail count matching the record total of 2001. The Sharpshin, Broadwing, and Kestrel all declined significantly, with the last two below average. Although there were fewer Harries than last year, it was still the second best count ever, and almost double the average. At **Morris Island** the Sharpshin, Merlin, and Peregrine numbers improved to above average, but Osprey and Harrier were scarce. Cooper's Hawk and Redtail remained above average despite a decline from 2007.

NEW HAMPSHIRE AND VERMONT

Broadwings and Bald Eagles did well at **Little Round Top**, Ospreys were average, but Sharpshin, Redtail, and Kestrel did poorly. The Cooper's Hawk surge faltered. The Interlakes School watch at **Meredith** had another slow season. The huge New Hampshire void near the coast was not filled by the new Concord site, but at least it is closer. **Carter Hill Observatory** showed decent numbers across the board, especially for Bald Eagle, Cooper's Hawk, Merlin and Peregrine. Numbers lagged a bit at **Pack Monadnock**, but not by much. Only the Bald Eagle, Goshawk, Redtail, and Peregrine dipped a bit below the four-year average, and the Broadwing flight was healthy. Only the Kestrel showed poorly at **Putney Mt**. Peregrine, Roughleg, and Golden Eagle set record highs, the Merlin and Bald Eagle were close, while the rest were near or above average.

EASTERN AND CENTRAL MASSACHUSETTS

The increase in hours was a little less this year, but **Pinnacle Rock** continues to be our only eye on the sky near the coast bend. Osprey, Cooper's Hawk, and Redtail were the highlights.

The Broadwing count dropped a little at **Mt Watatic**, but was still impressive, along with the Merlin total. Sharpshin and Kestrel suffered step declines, and hours were low for the sixth straight year compared to 1997-2001. A few late season days brought the Redtail back into view. At **Mt Wachusett** the Broadwing count was more than double each of the previous two years, the Kestrel continued at basement level, and other species were near "normal," except for the record Bald Eagle flight, more than triple the average. Hours came back up at **Barre Falls**, and most numbers were healthy, if not robust. The exception was the record Peregrine count. Sharpshin, Redtail and Redshoulder numbers verged on disappointing and the Merlin came down considerably from the amazing 2007 total.

CONNECTICUT RIVER VALLEY

The venerable **Mt Tom** site had a fair Broadwing flight over the half dozen days of coverage. Hours slipped a bit at **Shatterack Mt**, but the Broadwing didn't, coming over in record numbers. Most other counts were low, especially for accipiters and falcons. Coverage increased again to big levels at **Blueberry Hill**, bringing with it the best Broadwing flight since 2002 and a record Cooper's Hawk total. The Redtail count hit a rock-bottom low, with Osprey and Redshoulder also showing poorly. The Kestrel was at its lowest level, though not out of sight, as it threatened to be in the early season. It was a good Peregrine year and other species were near normal. Sheer effort took first prize at the Connecticut site in this region. **Peak Mt.** had to be abandoned after the early season, but watcher Joe Wojtanowski carried on at a site four miles to the southeast at **Poquonock** in the town of Windsor. Numbers suffered big time, especially for Sharpshin.

WESTERN CONNECTICUT AND UPPER HUDSON VALLEY

The inland Connecticut peak time watches were cut to eight sites in 2008, but the tradition still persists, this year producing more than 22,000 Broadwings, almost 400 Sharpshins and nearly 200 Ospreys. Most hours were provided by **Torrington Middle School** (81), **Botsford Hill** (71) **Chestnut Hill** (53) and **Flat Hill** (47) **Johnnycake** (40), and **White Memorial** (24). **Taine Mt** and **Booth Hill** had minimal coverage. Bald Eagles broke records at most sites, totalling 95 birds.

Our western outpost on the escarpment in **Helderberg** near Albany enjoyed its best count in six years of watching, mostly during the September peak. The Broadwing flight featured more than 1500 birds on 9/16, their best daily total by far. They also caught a big vulture movement in early October. Osprey and Bald Eagle had a good run, but accipiters and falcons were few.

COASTAL CONNECTICUT AND COASTAL NEW YORK

Lighthouse Point recorded its lowest total of migrants since 2000, with the fewest Sharpshins (48% below average) and Kestrels (69% below average) ever. Harriers were also hit hard and the Merlin count was 16% below average. On the bright side, records were set for Turkey Vultures, Bald Eagles and Peregrines. Osprey, Cooper's Hawk, Redshoulder, and Redtail

were all well above average, some having their best flights in many years.

The Osprey had an even better year at **Fire Island** than in 2007, and this time smashed the previous record high. The Peregrine was only slightly less spectacular, also reaching unprecedented numbers. The Harrier did not follow suit, falling to half the 2007 count and 16% below average. Accipiters improved, the Sharpshin only to half of its average in contrast to the Cooper's Hawk, which nearly doubled to set a new high by one over 2006. There was no good news for the Kestrel, and Merlin declined for the second straight year, though still almost average.

SOUTHEAST CONNECTICUT

Farther west along the sound, **Flirt Hill** had fewer hours and the Kestrel dove to less than half the 2007 count. Other species were also scarce. **Waveny Park** had fewer hours and lower counts. The news was good at **Quaker Ridge**, which recorded its best total migrant count since 1995. The Broadwing led the way, doubling last year's total and 30% above average. The Turkey Vulture also had a big season, breaking its previous high (2006) by 47%. Other species did not match this pace, though Osprey, Bald Eagle, Cooper's Hawk, Redshoulder, and Merlin were all well above average. The only gloomy news was the scarcity of Kestrels.

LOWER HUDSON VALLEY

The **Chestnut Ridge** site improved greatly compared to its 2007 "restart" year, setting record highs at the site for Turkey Vulture, Bald Eagle, Cooper's Hawk, and Peregrine. Osprey had its best year since 1990, Sharpshin its best since 1995, and Merlin its best since 1996. Harrier, Redshoulder, and Merlin were all well above average. Only Redtail and Kestrel showed poorly.

It was an uneven season at **Hook Mt**, with most species well below average and even lower than 2007. Only a record Bald Eagle flight and good numbers for Cooper's Hawk and Redshoulder cheered the counting. Nine Golden Eagles did not hurt either. Their second lowest Sharpshin count ever was an unwelcome highlight, a figure 41% below average. Broadwing was 62% below average, Osprey 32% and Redtail 26%. Coverage at **Lenoir Sanctuary** fell dramatically after a great effort in 2007. They watched there on many days, but only 1-3 hours on most of those days. The results were predictable, but per-hour figures were also down 60%.

Moving west over the Hudson, we find **Summitville** with a huge jump in vultures, perhaps a change in counting protocol. Harrier, Sharpshin, and Broadwing were lower than 2007, but most other species were higher and the most ever in the five years of coverage. **Mohonk Preserve** fell back in hours and counts for the second year in a row. At **Bear Mt** coverage was near normal, but results were mysteriously not. Every species but Redtail, which increased slightly, suffered steep declines.

It was an entirely different story at **Mt Peter** as the Broadwing took a gigantic turn for the better, almost matching its record

flight of 1981. Most other species went the other way, even Cooper's Hawk and Peregrine. The Bald Eagle only dropped by the count of one, still more than double the average. Some amounts below average were Osprey 27%, Harrier 33%, Sharpshin 58%, Redshoulder 45%, Redtail 46%, and Kestrel 63%. They look forward to their 30th season in 2009.

NORTHEASTERN NEW JERSEY

Results were mixed at **Montclair**, much like the last three years, when numbers were down, then up, then down again. In 2008 vultures were way up and Broadwings and Redtails were improved, but not enough to generate much elation. The Kestrel dropped to a record low level, while the Osprey, Sharpshin and Harrier approached that mark. Other species had healthy above average totals, but those were still not as good as 2007.

Picatinny Peak had only one bright note, the Broadwings soared to their third best total. The Kestrel, accipiters, Harrier, and big buteos went south figuratively instead of literally, as did the Osprey to a lesser extent. Even the Turkey Vulture, Bald Eagle, and Merlin were below average. The dismal pattern held true at **Wildcat Ridge**, where only the Broadwing had a better count than 2007, though still below average. The Osprey was close to its numbers the previous three years, but all other species except Peregrine were down and out - well below average.

It was more of the same at **Chimney Rock** putting New Jersey in need of a massive stimulus program. Broadwings were better, but everything else except Peregrine and a record number of Bald Eagles came up empty, or at least light, like our pockets and purses. It's hard to say what species suffered most, but Sharpshin hit a record low since full coverage in 1993. The Kestrel number dropped back to pathetic after two years of hopeful but slight increases.

SPECIES ACCOUNTS

The **Broad-winged Hawk** finally returned to normal, closely matching the 2002 per-hour total and 22% above the ten-year average. Three consecutive days of good flying weather September 16-18 probably made the difference. The winds were light, so the flight was spread over just about every region and watch.

The **Osprey** has become about as consistent as any species possibly can, matching the 2007 figure exactly and a single notch below its ten year average. It has held very steady for the last six years. After setting a high mark in 2004, the **Bald Eagle** dropped back the next year, then increased slightly the next two. The 2008 season saw it jump through the barrier again to a new per-hour high, 24% above the ten-year average and 79% above the 20-year. Over the last 12 years the **Northern Harrier** has followed a clear four-year cycle of three increasing years followed by a steep drop in the fourth year. 2008 saw another fourth year decline of 40% from 2007, to a point 19% below the ten-year average.

After seven steady years of per-hour counts, the **Sharp-shinned Hawk** plummeted to its lowest level ever, 8% less than the

previous low set in 2000. This is 20% below the ten-year per-hour average and 31% below the 20-year average. The decline is likely related to the light winds that prevailed last fall, many with an easterly component. This may also explain the pause in the increases seen in **Cooper's Hawk** numbers, which had risen each year since 1994. The drop this year was 11% from the 2007 level, but was still 8% above the ten-year per-hour average.

There is no good news for the **American Kestrel**, whose decline resumed with a vengeance after three years of little change. The per-hour rate dropped by a third from 2007 and now stands at a miserable 38% below the ten-year per-hour average. This is 60% below the 20-year figure. The **Merlin** suffered a similar fate, dropping by 19% after a five year string of stable counts. That put it at 13% below the ten-year average. The Kestrel to Merlin ratio declined to 2.3 to 1. **Peregrine Falcons** dodged the bullet of low numbers, likely because the same east winds that dispersed other migrants, deflected the ocean loving Peregrines inland. Numbers rose by 25% and they were 37% above their ten-year average.

There was not much change for the **Red-shouldered Hawk**, whose yearly counts have flirted with its average for six of the last eight years. It was a bit low in 2002 and a bit high in 2006, but otherwise stable. The **Red-tailed Hawk** put in its third straight season of performing at a level 25% below the ten-year average. It may not return to its previous numbers until the late season weather gets blustery again.

The **Turkey Vulture** departed from its humdrum consistency with a flight that was 37% above average. It seemed to be at least partly a genuine increase, though one wonders whether some watching protocol changes are playing fast and loose with the figures. By contrast, **Black Vulture**, counts took a nosedive, ending up 45% below the ten-year average per-hour its poorest showing since 2000.

The **Northern Goshawk** put on an even bigger migration move than last year, more than doubling its 2007 rate of passage. There were a few more **Rough-legged Hawks** than in recent years and the **Golden Eagle** came back to normal after a down year.

FLIGHT ACCOUNT

THE PRE-SEASON

The first watch was held on 8/16, but it was 8/20 before more than a handful of migrants began moving. The early action picked up starting 8/26, when three days of light northerly winds brought 158 migrants to Cadillac Mt., 149 to Chestnut Ridge, and 95 to Quaker Ridge. On 8/31 a stationary high started a four day stay just to our west, as a hurricane made landfall on the Gulf Coast. The light northerly winds on 9/1-2 sent 246 migrants past Lighthouse Pt., while Cadillac Mt. counted 153 on 9/2, and Chestnut Ridge had 127 on 9/3. The storm moved north and took two days to turn toward the northeast before passing through on 9/6. Modest numbers passed both before and after that day. There were 241 watch days and 4035 migrants.

Accipiters and falcons were in short supply, probably due to the light winds.

THE EARLY PEAK SEASON

The warm-ups were over and it was time for the birds to throw strikes and the watchers to connect. A large, lazy high pressure center hovered over the Great Lakes 9/10-11, bringing moderate north winds. The Broadwings flew on a broad front with 11 sites registering in the low hundreds the first day and Quaker Ridge topping out at 988. Nine more hit the same level the next day plus Mt Watatic at 634 and Pack Monadnock at 1448. It was a fine opening inning to the season, though other species seemed to be still in the dugout. On 9/12 a low pressure with a stationary front over the western Great Lakes brought clouds and rain. It dissolved the next day as systems stalled due to the landfall of another hurricane on the Texas coast. Some sites cleared enough to see the birds, notably three in New Hampshire counting Broadwings in the higher hundreds and a couple in New Jersey with more than a hundred. The storm moved inland, linking up with the frontal low on 9/14 as heat, haze and south winds closed down almost all migration. The empowered storm finally raced east and over us on 9/15, opening up only southern sites for the early birds to move on. Eleven sites broke 100, Montclair and Chimney Rock flirting with 500.

A second high pressure was centered in Kansas, this one so big it stretched from coast to coast. Some clouds lingered on 9/16, but the wind was light from the north and the Broadwings flew again. Eleven sites were over 100 and under 1000, 9 more were over 1000 but less than 2000. Shatterack and Torrington broke 2000 and Mt Peter hit one over the fence with 4000. The flights had moved farther west, and the birds just kept coming as weather systems barely moved. On 9/17 there were 16 sites between 100 and 1100. Little RoundTop exceeded 1500 in the north, and in the south Mt Peter reached 3564 and Picatinny 3866. Other species seemed dispersed as Ospreys at Lighthouse barely broke 100, and Quaker Ridge Sharpshins barely broke 200. Though there was no big change in the weather or flights, we will call this the end of the early peak season, one in which watchers logged 233 watch days and counted 73,697 migrants, 90% of them Broadwings.

The Early Peak Season Totals

	Hrs	BW	OS	BE	NH	SS	CH	AK	ML	PH

THE LATE PEAK SEASON

The first high center remained over Kansas on 9/18 as a second high forced a dry front down from eastern Canada and freshened the winds. The Broadwings saw no reason not to keep streaming on clearing skies and moderate north winds. It looked to be good day, and it turned out the very best of the season. The wind was strong enough to give Quaker Ridge the high count, over 13,000 Broadwings. Seven sites were in the 3000-5500 range, and 12 were in the 900-2600 range. Other species finally entered the picture as Fire Island counted 377 falcons and Lighthouse 556 accipiters. The new high was right over us the next day so the winds died and shifted easterly. The birds kept coming, but were much fewer, except at Picatinny (3363) and Wildcat Ridge (1933). Other species dropped off even more, 241 accipiters at Quaker Ridge, while Lighthouse and Fire Island almost died. The next four days saw two more dry fronts drop down from central Canada and keep the winds easterly. The pipeline dried up, or burst and dispersed. On 9/20 our western outpost, Mt Peter, almost reached 300 Broadwings. On 9/21 the high count was 57 and on 9/22 it was 75. We were getting that sinking feeling that there were no more big flights to come. On 9/23 five sites had 100-500 Broadwings and on 9/24 there were only two sites at that level. It was over. No complaints about the Broadwings, but other species were less than impressive. In 201 watch days we had tallied 88,398 migrants, 89% of them Broadwings.

THE ACCIPITER, FALCON AND LATE OSPREY SEASON

September 25 saw a tropical storm making landfall on the Carolina coast, starting its trek northward to cover us with rain and clouds for the next three days. Lighthouse was the only watch working on 9/26 (5 birds), four sites opened on 9/27 and 11 on 9/28, when numbers were paltry. After poor counts of other species during the peak Broadwing season, it was not a good way to start their peak season. The storm passed into the maritimes and the trailing front dropped down behind, bringing north rather than northwest winds. On 9/29 there was a nice coastal flight, but hardly a blockbuster. Lighthouse topped out at 404 accipiters and Fire Island totalled 156 falcons. The next day south winds ahead of an approaching front stifled the counts,. They remained so for the first five days of October, as a storm stalled over northern New England and two more fronts dropped down from the north. Only a brief window of sun on 10/4 brought a modest flurry of accipiters to some sites, notably Morris Island (261)and Lighthouse (228).

Finally a high centered in Ontario on 10/6 brought moderate north winds and some robust numbers to coastal Connecticut and New Jersey, though they quickly faded on lighter wind the next two

days. Then a front moved off the coast and the wind turned south on 10/9. A weak front fizzled the following day and a new high brought clear skies but more light winds on 10/10-12. Watchers at one or two sites scratched and struggled to find a hundred accipiters, most places found much fewer. This period was improved compared to the previous four years, but still a bust. In 342 watch days there were 25,305 migrants. Accipiters were a good 53% of the flight, falcons only 17%.

THE LATE ACCIPITER AND FALCON SEASON

High pressure prevailed over most of the region 10/13-15 with light and variable winds. The first and last day were better, since a back-door cold front moved into northern New England on 10/14, then retreated. The peak count was at lighthouse the first day with 207 Sharpshins and 117 Kestrels. Good Turkey Vultures counts at Barre Falls (133) on 10/14 and at Chimney Rock (140) on 10/15 were a forecast of more flights in the next ten days. A classic cold front with clouds and showers shut things down on 10/16, then stalled to the south of us. Quaker Ridge had 192 Turkey Vultures and Montclair 113. Four days of moderate northerly winds ensued that included the first Redtail flight of the season, but numbers were modest for all but one species, especially 10/20, when winds died. The exception was Turkey Vulture, for on 10/17 Lighthouse had 107, Montclair 117, and Quaker Ridge 114. On 10/18 Chestnut Ridge had 100, Montclair 93 and Quaker Ridge 133. After two days of rain and clouds, a clear day with moderate north winds closed out this very disappointing period on 10/23 when Chestnut Ridge had 133 Turkey Vultures, Montclair 113 and Quaker Ridge 110. For the period there were 11,270 total migrants, a mere 45% of them accipiters, 25% vultures, 10% falcons, and 9% buteos.

THE RED-TAILED AND RED-SHOULDERED HAWK SEASON

We had not had a highlight flight in more than a month and were due, but you don't always get what you want. The big buteo season began with clouds and rain 10/24-25, brief clearing 10/26, then three more days of showers. Barely a trickle of birds got through it all. October 30 dawned clear with brisk NW winds and some Redtails shrugged off the shock and finally flew, 78 at Mt Peter and 103 at Putney Mt. Light SW winds on the last day of the month put an end to that. November opened with a cloudy

day, but the winds were north and moderate. Redtails resumed their charge, but there was a decided westward tilt to their direction, 101 at Putney Mt. and 170 at Summitville. That last site had 149 Redtails the next day, a super two days that turned out the region's only late season highlight. Elsewhere Lighthouse only contributed 74 Redtails and 108 Turkey Vultures. On election eve clouds rolled in as a nor'easter was just starting its course up the coast. Western weather systems were blocked, winds died, and so did migration until the storm passed on 11/8. Strong west winds and clouds followed for three days, but the Redtails did not respond. The highest count was 45 at Quaker Ridge on 11/11. After that it was one storm after another with east winds and cold rains until 11/18. This time some Redtails paid attention, streaming by Lighthouse Pt. on strong northerly winds at an incredible pace, 208 total with 37 Redshoulders,

plenty of Turkey Vultures and Sharpshins, and a Golden Eagle. This and the next three days ended the season on a positive note, but did not make up for the disastrous days before them. There were 340 watch days, and a minuscule 10,951 migrants, buteos accounting for 42%, accipiters 25%, and vultures 18%. The rest of the season was also miserable, with only 400 migrants through December. The less said about it the better.
