

NORTHEAST HAWKWATCH REPORT

The North East Hawk Watch promotes the systematic study of migrating hawks in New England, southeastern New York, and northeast New Jersey. The planning for NEHW activities is carried on by the Officers and a Board of Directors. Membership is open to anyone. Annual dues are \$10 payable to the treasurer: Joe Wojtanowski, PO Box 142, Poquonock CT 06064. Other officers: Paul Roberts, President - 254 Arlington St. Medford, MA 02155; Larry Fischer, Clerk, 124 Sugar Street, Newtown, CT 06470.

Visit the website for North East Hawk Watch at www.battaly.com/nehw/ to download a membership application, view seasonal site totals at all sites and daily counts at selected sites for 2011, download the entire Hawkwatch Report for 2010, and find directions to hawkwatch sites in the Northeast.

All counts can be easily reported online through a free service offered by the Hawk Migration Association of North America. To sign up, visit www.hawkcount.org and click the 'Account Request' link. To receive daily reports from all sites using the hawkcount program, subscribe to BIRDHAWK, which is also free and can be done by visiting the HMANA homepage at www.hmana.org and following the simple instructions there.

If you are unable to use this online reporting system, single day (hourly) white report forms and seasonal summaries of daily totals should be sent to the state coordinators listed below by

August 1 (spring) and February 1 (fall). Timely submission is essential if this report is to be printed and mailed to you on time. Please contact the Editor about any errors you may find in the data, dates, observer names, or watch locations.

THE 2011 SPRING MIGRATION

COVERAGE AND SITE ACCOUNTS

Both accipiters took a big hit at **Sandy Hook** compared to 2010 and the average since 1977. Fewer coverage hours the last five years may explain some of this, but the Cooper's Hawk count was low even compared to those year's averages. Compare that to the American Kestrel count, which was 33% above the five-year average, and the most since 2000. Although down a bit from 2010, the Merlin, Red-shouldered Hawk, and Turkey Vulture were well above the short and long-term average, while the Bald Eagle count was a record high. Other species were on the low side, though not seriously. At **Montclair**, counts were mixed after the sterling results of 2010. The small falcons did not fall back at all, the American Kestrel having its best year since 2002, though still shy of the long term average. The Merlin and Bald Eagle set record highs for the second straight year. The Red-shouldered Hawk also had an excellent flight, only exceeded once before, in 1996. The Cooper's Hawk was very close to the high set in 2007. Osprey had a good year, but Sharp-shinned Hawk, Broad-winged Hawk, and Red-tailed Hawk were weak. Turkey Vulture was very much so. **Wildcat Ridge** continued its trend of fewer hours and lower counts, particularly for accipiters and falcons. The one day of watching did much to promote **Hook Mt.** as a productive and neglected site. The Broad-winged Hawk count that one day was enough to put it fifth place for a season total in the region. The total just beat out that day's count at Montclair, and was the highest for the region. The site deserves more coverage.

So does the **Suffield Wildlife Management Area**, which had no

coverage in 2011, after proving itself and its stalwart counter, Joe Wojtanowski. It is tough to lose such a dedicated watcher. After a good year in 2010, coverage lagged at **Barre Falls**. Per hour the count did not lag much, with decent totals for some species. Bald Eagle, Cooper's Hawk and Red-tailed Hawk were especially healthy. Species still below average were Turkey Vulture, Osprey, Northern Harrier, Sharp-shinned Hawk, and Red-shouldered Hawk. American Kestrel was near a record low level for the second year in a row.

Another drop in coverage hours brought **Pilgrim Heights** to a point 23% below average. Not all species fared badly, notably Turkey Vulture, Bald Eagle, Red-shouldered Hawk, and the falcons. The American Kestrel recovered from a disastrous 2010 to a point 22% above average. Osprey, Northern Harrier and accipiters were at record or near record low levels. Fortunes came out the opposite at **Plum Island**, despite a decline in hours. Per hour the passage rate for all migrants was a record high for years with comparable coverage, led by the second best American Kestrel total. Northern Harrier and accipiters were also well above the five-year average, while other species were near that level.

Pitcher Mt. only had three hours of coverage on one day, but results were again promising even for that minimal effort. The fifth year of full-time watching at **Bradbury Mt.** proved a slight reality check, as the tremendous flights of the last three years were not replicated. Still, the numbers were not unimpressive. Bald Eagle, Cooper's Hawk, and Red-shouldered Hawk were well above the

healthy averages. Northern Harrier and Sharp-shinned Hawk were hit the hardest of the remaining species, all well below average. **Greenlaw Mt.** repeated its first year success, matching most species totals and doing much better for Osprey and American Kestrel. Bald Eagles jumped from zero to 14. Another new watch in the Maritimes at **New Horton Ridge** showed it was a match for almost any other spring site in the east, showing excellent counts of every species, including Broad-winged Hawks and Sharp-shinned Hawks.

SPECIES ACCOUNTS

The **Broad-winged Hawk** flight dropped a bit from 2010, but was well above average for a second straight year. Per-hour it was 7% above average. Montclair had the highest count, and New Horton Ridge was next highest. The one day count at Hook Mt. was the fourth highest for the season at a site.

The **Osprey** bonanza of 2010 was not repeated, but even a sharp drop kept it a little above average. Bradbury Mt. squeezed out Montclair for top honors., but other sites trailed far behind. If the **Bald Eagle** count in 2010 was a tsunami, then 2011 was the ocean rise if all the glaciers thaw. There is no comparison to the past. Bradbury Mt. led the way. The **Northern Harrier** fell short of its absolute count, set in 2008. Per-hour it just missed equalling the high set in 2004. Plum Island and Sandy Hook supplied the bulk of the numbers.

The euphoria of the **Sharp-shinned Hawk** resurgence faded quickly, but it did not give way to despair, as the total and average remained healthily high. The **Cooper's Hawk** dropped to near average, well below two years of spectacular counts. The Sharp-shin/Cooper's ratio was 7.0 to 1 compared to the 7.6 to 1 in 2010 and the ten-year average of 6.1 to 1. The **Northern Goshawk** turned in a good total, and has been steady for four years.

The **Red-shouldered Hawk** equalled its decent 2010 showing, and was well above its 10-year average. Again, Sandy Hook, Montclair, and Bradbury Mt, provided the bulk of the migrants. After a big year in 2009, the **Red-tailed Hawk** improved its 2010 flight a bit, which put it almost at the per-hour average. New Horton and Bradbury Mt. contributed well over half the total, though Barre Falls also had a robust figure. The ratio of Redtail to Redshoulder was again 2.7 to 1, still below the ten-year average.

After the precipitous crash of 2003-2007 the **American Kestrel** showed a nice recovery the next three years, but nothing prepared us for the huge flight of 2011. The absolute count was more than double its 10-year average, and the per-hour total was nearly the same. It was the most migrants counted ever and the most per-hour since 1996. The coastal component was huge as usual, led by Plum Island and Sandy Hook, together accounting for two-thirds of the birds. **Merlins** refused to take a back seat, bettering their record per-hour numbers of 2010, and only barely short of the record absolute total. Sandy Hook was huge for this species. The ratio was 5.1 Kestrels, to 1 Merlin. After three big years, our transplanted falcon, the Peregrine, was back to earth with a count just above average, both absolute and per-hour.

There were a few wandering **Black Vultures** seen outside of the numbers at Montclair and Sandy Hook. **Turkey Vulture** were scarce, amounting to below average per-hour. Pilgrim Heights had ten **Mississippi Kites** and Sandy Hook one, but there were four **Rough-legged Hawks** and two **Golden Eagles**.

FLIGHT ACCOUNT

March 12-24

February was bitter cold and then a prolonged period of clouds with mostly east winds prevailed during the first eleven days of March. Eight days of watching during that period produced a dozen migrants, hardly worth the effort, but watchers are nothing if not eager. The return of sun and west winds March 12-16 sent 16 Redshoulders and 21 Redtails over Bradbury Mt. and 15 Redtails over Barre Falls. New Horton had 43 Redtails on March 21 and Sandy Hook had 38 Turkey Vultures the following day. There were 52 watch-days and 278 hours of coverage in this period, the 783 migrants giving a rate of 2.9 per hour. There were an equal number of Turkey Vultures and Redtails, together amounting to 56% of the flight. Ther were 95 Redshoulders and 127 accipiters,

March 25-31

The end of March saw a string of clear skies with northwesterly winds, often strong. All species stayed scarce until March 31, when 21 Redtails went past Greenlaw Mt. and 56 past New Horton Ridge. Over 47 watch-days and 500 hours there were only 1404 migrants, a rate of 2.8 per-hour, well below the 4.2 of 2010 in the period. At 55% of the flight, the vultures left behind the big buteos at 16%, and trampled the accipiters at 9%. The Ospreys, Bald Eagles, and Northern Harriers together were more numerous at 11% of the total.

April 1-13

It rained the first day of the month and then the winds veered light westerly on April 3-5. Migrants roared through the region until rain came on April 8. Good counts on April 4 were 263 at Montclair and 144 at Sandy Hook. Bradbury Mt. added 135 April-7-8 as the rain shut down southern sites. Before that, on April 6, Plum Island burst into life with 398 migrants, and Sandy Hook added 158. A nice count of 30 Ospreys passed Bradbury Mt. as the rain ended on April 9. The next few days were cloudy and showery, and the only movement was a massive flight of 175 falcons past Sandy Hook on April 12. There were 72 watch-days and 432 hours with a final tally of 2624 migrants, putting the passage rate at 6.1 per-hour. Big buteos were 12%, accipiters 18%, falcons a robust 37%, Northern Harriers and Ospreys together 17%.

April 14-19

The flight building up to our south finally reached us when the weather cleared and winds were light on April 14. It brought 375 migrants over Montclair and 221 over Barre Falls, most of them Broadwings, the first real movement of the season for our little buteo. Another bout of clouds and rain halted the migrants again on April 16. Strong west winds the next day kept numbers modest, only 175 Broadwings at Montclair, but other species mounted a charge, 92 accipiters at Sandy Hook and 118 falcons at Plum island. The birds headed northeast on lighter winds April 18, pushing Broad-winged Hawk totals to 174 at Barre Falls and 146 at Bradbury Mt. That day Sandy Hook counted 132 Sharphshins and Plum Island 219 Kestrels. Showers ended the period in most places on April 19, but New Horton Ridge was far enough north to greet 113 Broad-winged Hawks in their home stretch. This early prime period had only 45 watch-days and 263

hours, but produced 3630 migrants at an impressive rate of 14 per hour. Broad-winged Hawks were 38% of the total, accipiters 17%, and falcons a whopping 27%.

April 20-May 3

A warm front headed up the flyway on the first day of the late prime period, and plenty of migrants came up behind it on the strong southwest winds. The falcons flew past Sandy Hook big time, 360 if them. Broadwings were more inland, 194 at Tussey Mt. and 316 at Washington Monument. A cold front went through that night, but the subsequent strong northwest winds on April 21 did not deter the birds, only pushed them eastward. Montclair noted 660 Broadwings and the one-day watchers at Hook Mt. 712. Wildcat Ridge had 145, and farther north, Talcott Mt recorded 249. Those falcons made good time, 388 Kestrels and 18 Merlin reaching Plum Island. With light winds on April 22, 122 Broadwings passed Barre Falls, but farther south snow and rain arrived to spoil the fun. Our region cleared and winds turned south on April 24, letting Broadwings resume their passage, 140 at Bradbury Mt. and 115 at Greenlaw Mt. The wind encouraged

Sharpshins, 256 moving over Sandy Hook. Falcons were not left out, Plum Island counting 81 more American Kestrels and Sandy Hook 40 more Merlins. Those south winds held steady and brought a warmup throughout the east that lasted until April 28, but the bulk of the birds were gone. Still, there were 113 Sharpshins at Sandy Hook April 26, then 155 Broadwings and 60 Kestrels at Bradbury Mt. April 27. Winds then turned northerly and the air cooled, dying as May began. The only flights on April 29 were in New Brunswick, 210 Broadwings at Greenlaw Mt. and 339 at New Horton Ridge. There was another rain event on May 4, but another pulse of birds followed, featuring 115 Sharpshins at Plum Island May 6. This period did not provide the bonanza that flooded by us at the same time in 2010, but it was not a fizzle either. Watchers were on their stations for 93 watch days and 595 hours. The 7974 migrants gave us a passage rate of 13.4, down from 2009 and 2010, but near average. Broadwings accounted for 45% of the total, accipiters 23%, and falcons a robust 19%

THE 2011 FALL MIGRATION

Of the 37 sites reporting more than one or two days of coverage in 2011, five had coverage greater than 500 hours, led by Chestnut Ridge with 635. Eight had coverage of between 360 and 430 hours, and six from 250 to 330. There were eleven in the span from 60 hours to 150 and five from 20 to 45. Significant changes to the roster were the addition of Alna, a watch in northern Maine, the return of Lenoir, Helderberg, Poquonock and Suffield, and the absence of Morris Island, Waveny Park, and Mohonk Preserve. Ther were no sites with substantial increases in hours, but a sensible reduction was shown by Chestnut Ridge..

NORTHEASTERN COASTAL SITES

Greenlaw Mt celebrated its third year with its first big Broadwing day and a good count of Turkey Vultures, Sharpshins and Redtails. Other species held their levels. The new site at **Alna** had its big Broadwing day in its very first year, and showed great promise as a regular watch for all species. It took 17 years to get a big Broadwing day at **Cadillac Mt**, but it was worth the wait. Turkey Vultures and Peregrines also reached record levels, but other species were low, most notably Sharpshins and Kestrels. **Harpswell Peninsula** did not rebound from a poor 2010, showing steep declines for Harrier, Sharpshin, and Merlin. Kestrel, Redtail, and Osprey continued very low, and the only species much above average were Turkey Vulture Bald Eagle and Cooper's hawk. Hours fell back at **Pinnacle Rock** and all species except a record most Bald Eagles took a hit.

NEW HAMPSHIRE AND VERMONT

The **Carter Hill Observatory** in New Hampshire also had a super passage of Broadwings, and most other species were plentiful, especially Osprey and Bald Eagle. Most numbers suffered very little with fewer hours at **Pack Monadnock**, starting with yet another big-time Broadwing count. Only late season species dropped, Harrier, Redshoulder, and Redtail. The **Putney Mt.** Broadwing count was not great like some others, but not bad either. Highlights were a record high for Turkey Vulture, all three accipiters, and Golden Eagle (tied). Bald Eagle and Merlin continued high, but Peregrine slipped downward.

INLAND MASSACHUSETTS AND UPPER HUDSON VALLEY

When coverage falters, it is hard to gauge a trend or make much comment except reciting the lower numbers. This was the story at both **Mt Watatic** and **Mt Wachusett**. The latter came close to last year in hours and numbers, the former, dropped in all regards. **Barre Falls** was stalwart as usual, and the counts were good. Osprey, Redtail, and Kestrel, were a little weak, but most others were strong, especially for Bald Eagle, Cooper's Hawk, and Broadwing. **Mt Tom** hit the Broadwing flight big again, as in 2010, but that was it for coverage. Counts were comparable across the board at **Shatterack Mt.** except for a shortage of Osprey, and a healthy supply of Turkey Vultures and accipiters. Osprey. Below average totals continued overall at **Blueberry Hill** and were especially low for late season buteos. Only the Osprey was above average. No **Helderberg** report reached my

desk last year, but the 2011 results came in by post this year. Bald Eagle, Broadwing, and Kestrel were above average, while other species at or below that point.

CENTRAL AND WESTERN CONNECTICUT

After a brief hiatus, the **Suffield** watch in the central valley was renewed and caught an excellent Broadwing movement. The **Poquonock** site was also covered again after taking a break from its record hours of watching in 2009. Only five watches in the western hills had more than one or two days of coverage, but most of them did fairly well. The **Middle School** in Torrington duplicated its fine coverage last year and improved its Osprey and Broadwing count. **Botsford Hill** was not so fortunate with most species, including Broadwings, but did have a record Cooper's Hawk total. **Chestnut Hill** increased its Broadwing count, but two Kestrels was a very distressing number. After a dismal Broadwing flight in 2010, **Johnnycake Mt** enjoyed a huge passage in 2011. The Cooper's Hawk set a record and other numbers were average. **White Memorial** watchers put in only 20 hours with modest results.

SOUTHEAST CONNECTICUT AND LONG ISLAND

Lighthouse Point managed a nice Broadwing flight, but the picture was not so bright for most other species. The exception was a record Peregrine flight, with most other species well below average. The Cooper's Hawk nearly matched the 2010 big count, and Bald Eagle numbers were high, but not a record. Every other species was well below the norm. In its third year, **Boothe Park** did not suffer a let down. The Broadwing movement was massive, while accipiters and late buteos were mightily improved. The Turkey Vulture was even more improved, but Osprey, Harrier, and Kestrel did see a relapse. The fabled **Quaker Ridge** watch was a bit below the average, but that is still impressive. The Broadwing flight was a mite on the light side, as was Osprey, Harrier, Redtail, and Kestrel. Even the Bald Eagle was low compared to the previous four years. The Cooper's Hawk was excellent, as expected, and the Sharpshin average, which is not as common lately as one would like. Big falcons flew well and often.

LOWER HUDSON VALLEY

Moving westward, the gloomy picture changes, as **Chestnut Ridge** basked in a range of great numbers, starting with the best Broadwing total since 1987. Nearly every other species was off the chart in the better sense. The only below average counts were for the Kestrel and the Harrier. Especially abundant were Turkey Vultures, Ospreys, Cooper's Hawks, Merlins and Peregrines. Even the Redtail reached its highest lvel since 1999.

At **Bear Mt** the good results of the 2010 season were only a fond memory as 2011 brought a return to the grim levels of 2008. Counts werre low across the board, especially for late buteos, a consequence of less coverage then. One has to go back as far as 1981 to find a better Broadwing flight at **Hook Mt**. Other sites

were left far behind by the legions that passed by on the big day of Sept. 17. The mediocre counts for almost all other species faded in the face of such an experience. Only the big falcons did well, the Merlin for the second straight year. Farther west, **Summitville** had a mixed season, Osprey, Sharpshin and falcons doing fairly well, but other species in short supply, especially Harrier and even Bald Eagle. Only one day of coverage was reported from **Mohonk Preserve**. Hopefully they will follow the example of **Lenoir Preserve**, where a lost season in 2010 was followed by a successful return in 2011. The counts were very close to average for many species, but Osprey, Kestrel, and all three buteos were well short of that mark, and Turkey Vulture was well above it. **Mt Peter** followed up a superb 2010 season with one almost as good. Only Harrier, Redtail, and Kestrel were below average, and the Cooper's Hawk soared to a near record high.

LONG ISLAND AND NORTHEASTERN NEW JERSEY

Fire Island watchers did their usual yeoman work, but the results were less than exhilarating. Only Cooper's Hawk exceeded the average, though Osprey, Merlin, and Peregrine came close. Harrier and Kestrel were both in the basement. The **Marine Nature Study Area** at Oceanside also saw a shortage of birds across the board. Hope of a full time watch at the **State Line** site has been fulfilled, and the promise of previous years work has also come true - in spades, or rather migrants. Ospreys, accipiters, and falcons were especially numerous, including an amazing flight of nearly a hundred Peregrine Falcons in a single day. The enigma of **Montclair** continues, with weak and strong flights alternating since the year 2000. The 2011 season was a weak one, every species showing a decline from 2010, with only Turkey Vulture, Bald Eagle and the bigger falcons managing to stay above average. The late buteos were especially scarce, the Redtail hitting a record low. **Wildcat Ridge** did not follow this path, starting with the largest Broadwing flight since 2000. Turkey Vulture, Osprey, and Bald Eagle also showed very well, Harrier, Redtail, and Kestrel showing poorly. It was a very good year at **Picatinny Peak**, especially for accipiters and Broadwings. Ospreys, Bald Eagles, and the big falcons were not as impressive, but also above average. Only a dismal Redtail count marred a successful season. Due to a lack of data, I was wrong when I said last year that the "big buteos really took it on the chin" at **Chimney Rock**. But I might have been prescient, since they did have an awful 2011. Harrier, Kestrel, and Merlin also fell to well below average, with most other species close to that level. Only the Bald Eagle stayed strong.

SPECIES ACCOUNTS

The year 2011 gave us renewed hope that the **Broad-winged Hawk** was not in decline. Kettle lovers could not have been happier, at least those in the right locations, which were not the traditional ones for a season of regional high numbers. There was only one day of strong northwest winds to flood the coastal alley with the thousands that usually make for a big seasonal total. Instead it was the central alley that got the goods, places like Carter Hill and Pack Monadnock in New Hampshire, Chestnut Ridge and Hook Mt. in New York, and Picatinny Peak and Wildcat Ridge in New Jersey. It did not hurt to have some

new stations on the watch in the far north. Greenlaw Mt. and Alna Maine gave the Broadwing count a jump-start. Coastal and western sites did not exactly get left out either. There was plenty to go around. When the skies cleared the little buteos had reached a mark greater than any since 1994. Per-hour the number was more than 50% higher than the 10-year average and 20% more than the 20-year average.

Now the not-so-good news. If counts of other species are any indication, we can hold our applause. It seems that the **Osprey** has finally settled into a groove. Absolute counts for our signature species have stayed steady in five of the last six years, and per-hour in ten of the last eleven. The only groove for the **Bald Eagle** has been straight up, but in 2011 it paused in its relentless increase. Since the surge began in 2002, it has shown a slight fall-off in 2003, 2005, and 2007, but this is the first such drop since then. The seesaw status of the **Northern Harrier** has not changed, and probably won't, due to its peculiar breeding habits. The down and up swings were especially severe the last three years. The count was nearly the same as 2008 and slightly more than half the 2009 figure. It was 24% below the 10-year average.

The **Sharp-shinned Hawk** took a little tumble from 2012, but not enough to bring it to its 10-year average. It was a tad under the 20-year figure. After a huge jump in numbers last year, the **Cooper's Hawk** did not fall back as it often has. Instead it inched upward ever so slightly. The Sharpshin to Cooper's ratio dropped from 7:1 in 2010 to 6.3:1. It has stayed close to 7:1 since 2005.

Apparently the **American Kestrel** resurgence in 2010 was an anomaly. The 30% drop from that figure brought our hunting falcon to 16% below the 10-year average and 43% below the 20-year average. Is it safe to say that its northeastern population has nearly been cut in half? It was a drop-back year for the **Merlin**, making one wonder if the fabled increase in this species will ever kick-in. Based on the 2010 flight, it finally had, but in 2011 a 35% decrease left it 11% below the 10-year average. Except for 2010, the counts have been rock-steady per-hour since 2001. The increase in **Peregrine Falcon** numbers is real, showing a slow, but steady climb per-hour since 2000. The rather significant drop per-hour in 2011 is the first indication of a possible correction. The ratio of Merlin to Peregrine has been low for three of the last four years, about 2.3:1.

The late-flying buteos were both hammered in 2011. The **Red-shouldered Hawk** slumped by 25% compared to 2010, hitting its lowest level since 2003. Still, it was very near the historic average. It has strayed from the average very little over the years, in fact only once, in 2010. The **Red-tailed Hawk** has been more volatile, straying from its average often. 2011 was a big down year, plummeting to 23% below the 10-year average, a level reached in 2009. The **Turkey Vulture** count went crazy, or maybe the counting has. The huge increase was mostly due to an unprecedented total at one site. A reassessment there may be in order. However, even adjusting the figure at that one site would still leave the regional count at its highest level ever, 30% above its ten-year average per-hour.

FLIGHT ACCOUNT

PRE-SEASON August 16-September 8

Watch effort in August and early September is dropping, an excellent development, in my opinion. Why burn you eyes and enthusiasm out before the real action starts? These are summer days, even more now than ever, thanks to climate change. There were 181 watch days (80 less than 2010), and 1789 migrants, slightly more than half the total in 2010. Without our new northern sites, the results would be even more minuscule than there are. As if to punctuate the tropical character of the pre-season, there were two intense storm events, one at the end of August and another on September 6-8, the latter causing widespread flooding.

The Pre-Season Totals

	Hrs	BW	OS	BE	NH	SS	CH	AK	ML	PH

THE EARLY FLIGHT SEASON - September 9-27

The season started slowly with winds moderate and mostly from the southwest. On 9/9 a mere 100 Broadwings went over Greenlaw and 157 Sharpshins cruised past Cadillac. The next day showed only a little more promise as well as progress, as light northerly winds brought Broadwings over Watatic (1400) and Pack Monadnock (500). About 400 were counted at Wildcat Ridge and Picatinny Peak. Winds were southwest on September 11 and results were repeated, rather than improved, 1600 at Little Round Top with about 400 at Monadnock and Putney. Helderberg saw 465, showing the birds were not being blown east. The peak Sharpshin count was at Hook, barely over 100. The southwest winds continued for four more days, a not surprising extension of summer. High daily Broadwing counts ranged from 100 to 300, and they were all well inland.

A front with showers finally wandered past, bringing clear skies and brisk north winds on September 16. We quickly learned that migrants had been moving, though slowly, and dispersed over the region. All those birds quickly bunched up at south-coastal sites from Lighthouse to Chimney Rock. Seven of those had more than a 1000 Broadwings, peaking much higher at Quaker Ridge and Boothe Park. The wind died the next day, but remained northerly, sending a ton of birds over southwest sites, breaking the bank at Hook (14000+!!!!), Chestnut Ridge, Wildcat and Picatinny. At the same time a new surge coasted past Alna (8000) and Greenlaw (3000), the forerunners reaching central New England sites like Barre Falls and Pack Monadnock later in the day. The crest passed through new Hampshire September 18 (Carter Hill 7000, Monadnock 5000), but the wind had turned easterly and was still a gentle breeze. South-coastal sites dried up, and Mt Peter was on the eastern edge of the broadening alley with 2000 birds. Southwest winds resumed on September 19 with the flight found over the same locations, but dwindling in number.

A fast moving system pushed clouds over us the next day, with

clearing from the south on September 21, when New Hampshire again got a glimmer of a flight on light westerly winds. Then followed two days of clouds and showers with barely a brief break from time to time. Then followed six days of drier weather, but still cloudy with light east winds. Broadwings passed through in small numbers every day through the end of the period. At the same time, accipiters began to assert themselves, coastal sites posting modest daily peaks of 100-200 September 25-26. It was too little, too late. Without the big Broadwing flight of September 16-18, the early season would have been considered barely average.

The Early Flight Season Totals

THE MID-FLIGHT SEASON September 28-October 30

September ended and the mid-season began with a mixed bag of weather, cloudy, showers, more clouds, clearing, east then south winds. Lighthouse managed to squeak in 500 migrants on the first day, none on the next, 200 on the third. Almost half of the 300 migrants at State Line the first day were Ospreys, but that count pales compared to the extraordinary movement of 98 Peregrines along the bluffs. On the third day ten sites had modest flights, but only Picatinny had more than 260 birds, and almost half of its 340 were Broadwings. The first three days of October repeated the mixed weather and the modest counts. The turn of the month seems to be jinxed the last few years, but there was enough decent weather over six days to produce over 8500 migrants.

October 4-5 cleared the skies, guided the wind, filled the air and brought out the smiles. On the second day a dozen sites breached the century mark, led by Lighthouse (1340), Fire Island (507), and Harpswell (452). Accipiters and falcons dominated more than usual. The wonder is, on the next day the weather held the same, and so did the numbers. On the last good day, inland sites took over as the wind died (400 at Quaker and Chestnut Ridge). These four days of good weather brought us over 13,700 migrants

Then all watchers were held hostage by one of those autumn warm spells for five days. That was followed by three days of clouds and rain. Mid-month brought clearing and a glimmer of hope, but the west winds were so strong that they knocked even the strongest migrants out of the sky. This time dying winds on October 17 were a good sign, and the impatient birds began to move. Light wind may let them fly, but it does not push them where we want them most, so we waited a little longer for bigger flights.

They came after two days of rain October 19-20. Winds were again west, but moderate this time. Nine sites had 100-200 birds the first day, then 11 sites the next day, plus a 500 migrant day

at Chimney Rock. Numbers fell as the wind veered more from the south, but October 25 brought northwest winds, a creature once common in the fall, but now as scarce in the east as a Golden Eagle. Lighthouse and Chestnut Ridge reached 500 migrants, five broke 200, and two more had more than a century. east. It was a decent five days totally 10,400 migrants.

Then two days of clouds and showers with east winds, another interruption that might mean the end of the season. Despite a lot of contrary weather, it had already been a surprisingly good month, but the last three days held another big push, as well as one extraordinarily bad day of weather. October 28 was a perfect migration day, mostly clear skies and moderate northwest wind. Central and southern sites had a ball with nine sites having 100 plus days, including nearly a thousand at Boothe Park and over 600 at Lighthouse. A few Redtails had moved earlier, but that day Boothe Park had an enormous count of 218. The storm hit the next day but went though quickly, letting the flight continue the penultimate day of the month, but only on the coast. There nine sites had over a hundred birds, topping out at nearly 500 at Lighthouse, plus a good flight of Redtails at Summitville (123). About that storm - around two feet of snow, uncountable felled trees and broken branches, and a week or more without power. But we counted 6500 migrants!! It was the best mid-season in quite some time. 50,919 migrants on 628 watch-days. The flight shares were 50% accipiters, 13% falcons, 15% vultures, and 9% Ospreys, Bald Eagles, and Harriers.

THE LATE FLIGHT SEASON October 31-December 1

If October was abnormally stormy, November was uncannily calm. Winds on the first 5 days of the period were light and north, and the leading feature were Turkey Vultures, especially at Chestnut Ridge. Redtails were oddly few, although Lighthouse posted 109 and Chestnut Ridge 144 on November 4. The skies contuned nearly empty after that, except for huge Turkey Vulture flights at Chestnut Ridge on Novemebr 17 and November 30. In fact, without that species, the period would have been the most dismal on record. As it was, there were only 8872 migrants over 1720 hours, 29% buteos, 17% accipiters, and 43% vultures.
